EFL FANTASY FOOTBALL

Draft Board User Guide

A live draft board for ten teams, twenty rounds and six keepers each, snaking from round seven. Everyone in the room sees every pick the moment it lands. Player data comes from FantasyPros rankings and ESPN stats and outlooks.

PART ONE

For every manager

Signing in, reading the board, making a pick, the player card, the cheatsheet and favorites.

PART TWO

For the commissioner

Boards and settings, loading players, running the clock, trades, exports and recovery.

PART ONE

For every manager

Signing in

Open the board's web address. Pick your draft board from the list at the top, then sign in. Your sign-in is remembered on that device, so you only do this once.

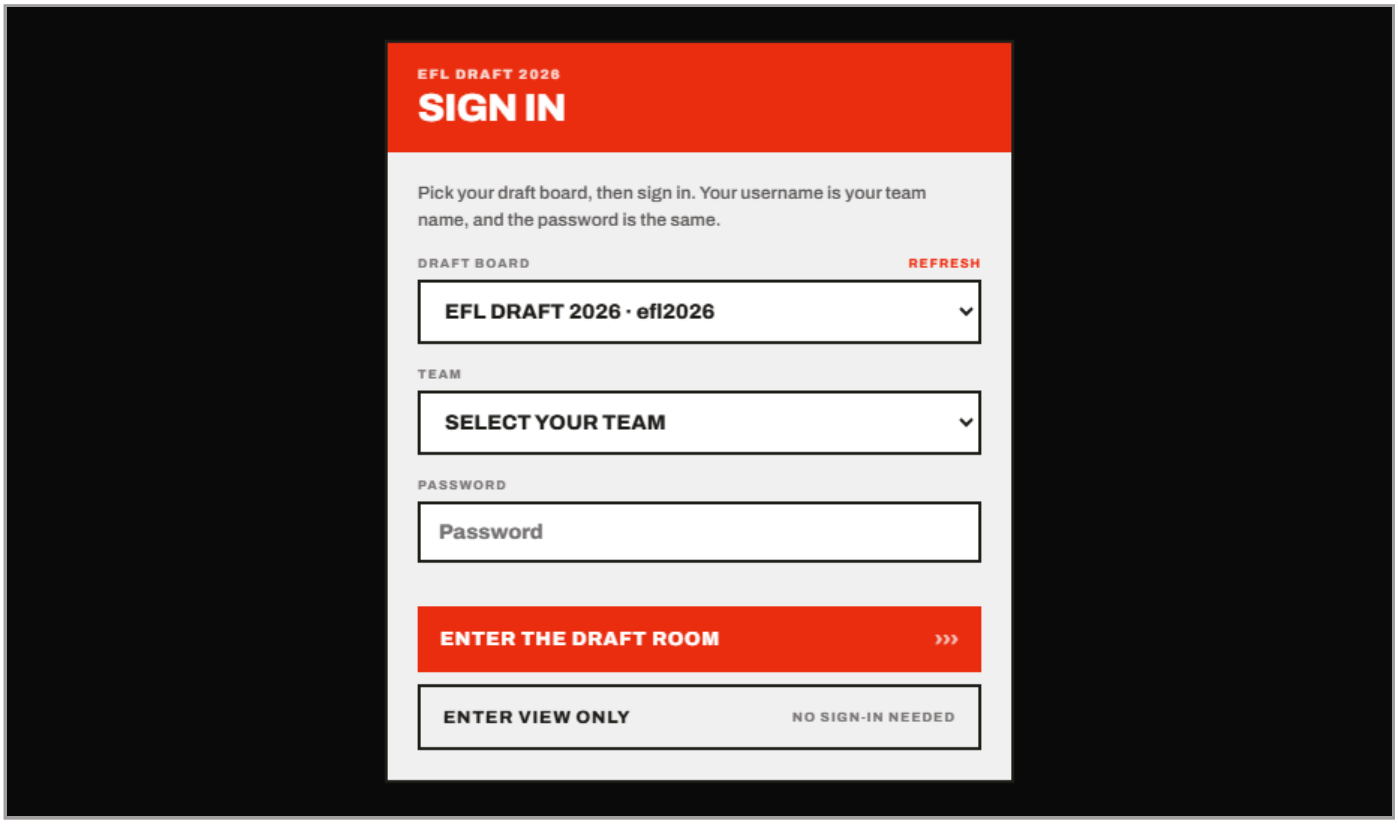

FIG. 1 — SIGN IN. BOARD, TEAM, PASSWORD, THEN ENTER THE DRAFT ROOM.

Manager	Your username is your team name, and the password is the same. Pick your team from the dropdown and type it.
Commissioner	Admin / admin, or Admin2 / admin2.
View only	Enter View Only, under the red button. No name, no password. You see the whole board and everything else, but you cannot draft, and the Best Fit panel and Favorites are hidden.
Refresh	The small link beside Draft Board re-reads the board list, in case the commissioner just created yours.

The draft room

Everything lives on one screen. The left column is about your next pick; the right side is the board and the player data. The strip across the middle is the clock.

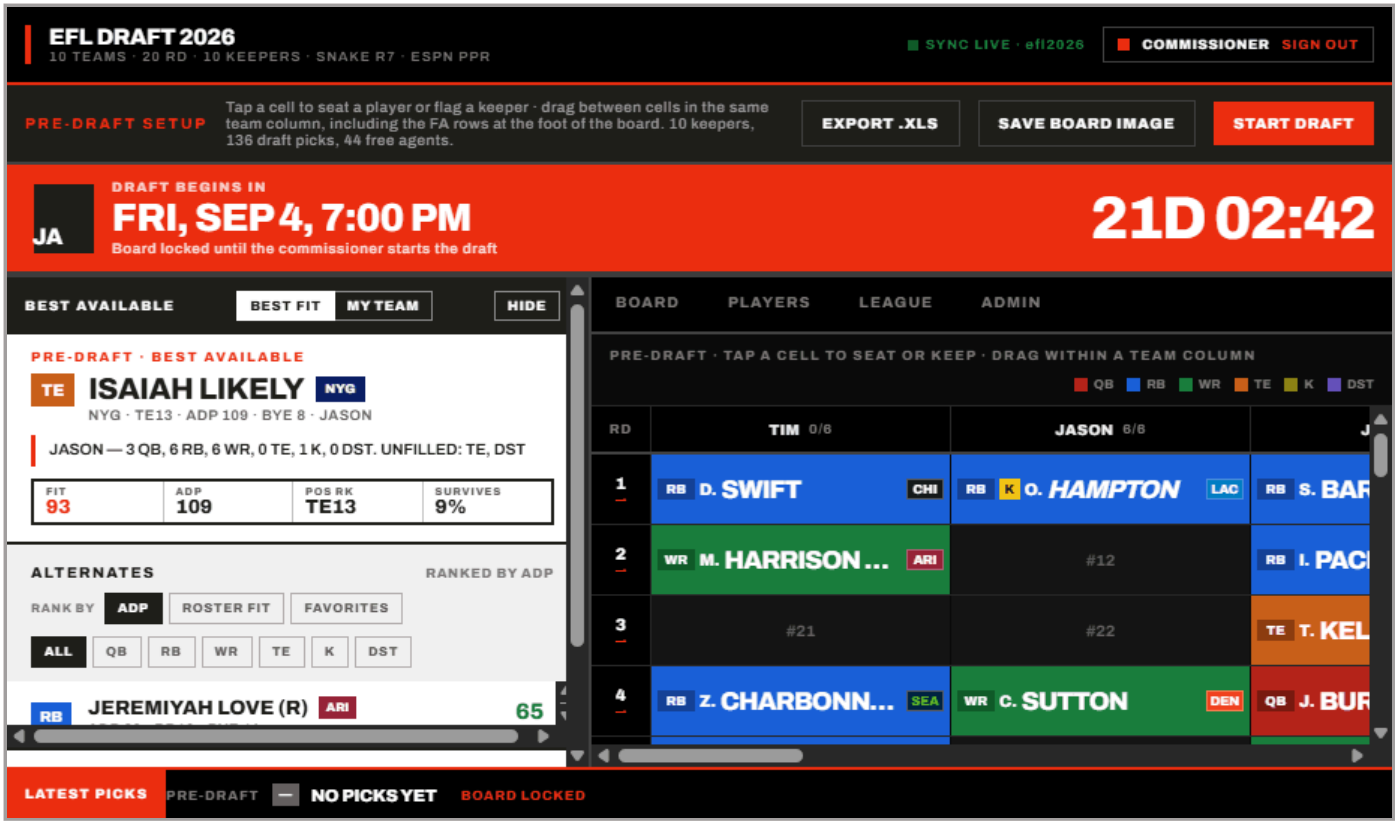

FIG. 2 — THE ROOM BEFORE THE DRAFT OPENS: COUNTDOWN ACROSS THE MIDDLE, BEST AVAILABLE ON THE LEFT, THE BOARD ON THE RIGHT.

Top bar	League name and format on the left. On the right, the sync light — it reads SYNC LIVE with the room name when your device is connected — then who you are signed in as, and Sign Out.
Clock strip	Before the draft it counts down to the start time and says the board is locked. Once the draft is running it shows whose pick it is and the seconds left. It turns deep red when the pick is yours.
Best Available	The left column. One recommended player at the top with a fit score, then Alternates underneath. BEST FIT and MY TEAM switch between the recommendation and your own roster; HIDE collapses the whole column.

Latest Picks	The ribbon along the bottom, scrolling the last few picks as they land.

The tabs

My Pick	Your clock, your roster and the pick in front of you. On a phone this is where you draft; on a wide screen the same information is already in the left column, so the tab only appears on small screens.
Board	The full grid — every round, every team, every pick.
Players	The whole player pool, searchable and filterable, plus the Cheatsheet.
League	Every team's roster, grouped by position.
Admin	Commissioners only. Part two of this guide.

Making a pick

1. When it is your turn the clock strip turns deep red and the timer starts. The cell you are picking into also carries its own small countdown, so you can see the clock without looking away from the board.
2. Find your player — from Best Available, from the search box under it, from the Players tab or the Cheatsheet, or by tapping an open cell on the board.
3. Confirm. Every pick asks once before it lands, so a mis-tap costs nothing.

Your pick appears on every other screen in the room within a second or two. The clock is a prompt, not a gate: running out of time never blocks you, and never gives your pick away.

You can only draft when the pick is actually yours and the draft has started. Everywhere a Draft button appears it follows the same rule, so there is no way to pick out of turn by accident.

Reading the board

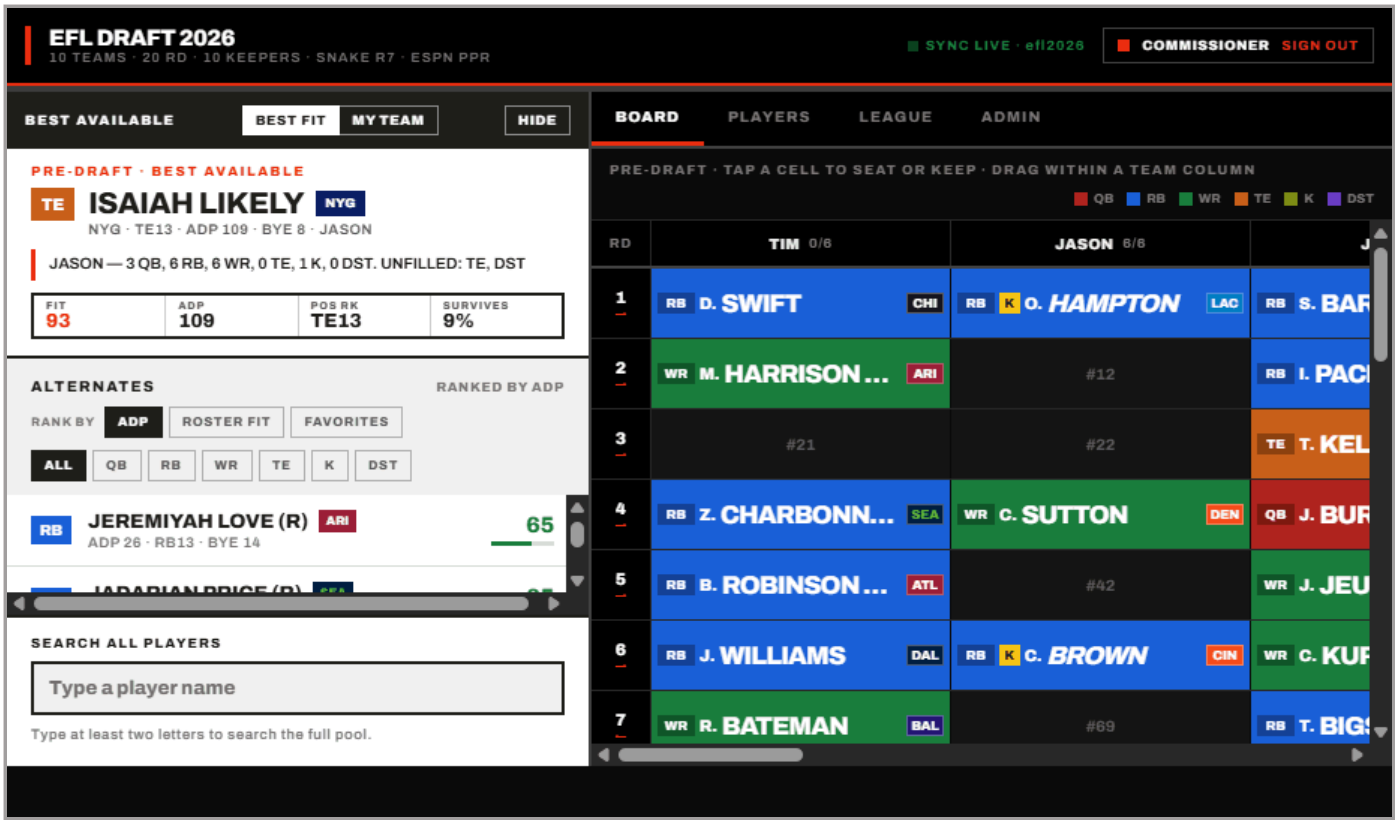

FIG. 3 — THE BOARD. ROUNDS DOWN THE LEFT, TEAMS ACROSS THE TOP, POSITION COLOURS DOING THE ORGANISING.

Colours — Each position has its own colour, so a team's shape reads at a glance. The key sits above the grid.

Team header — Each column is headed by the team name and its keeper count. Tap the name to open that team's roster.

K badge — A yellow K marks a keeper. Keeper names are set in bold italic.

(R) — A rookie, everywhere the name appears.

NFL badge — The player's current NFL team, in that club's colours. It follows the live player data, so a player who signs elsewhere updates on the board too.

Arrow — A traded pick. The cell that received it shows an arrow; the team that gave it up shows TRADED TO in the empty slot.

Stacked cells — Two or more players in one cell means picks were traded into that slot. They share the cell height and size down together.

FA rows — Below round twenty, free-agent rows hold signings made after the draft.

A team's roster, from the board

Tap any team name in the board header. Their whole roster opens, grouped by position and ordered by ADP inside each group, with the NFL team, position rank, bye week and the round that took each player. It is the fastest way to see what somebody still needs.

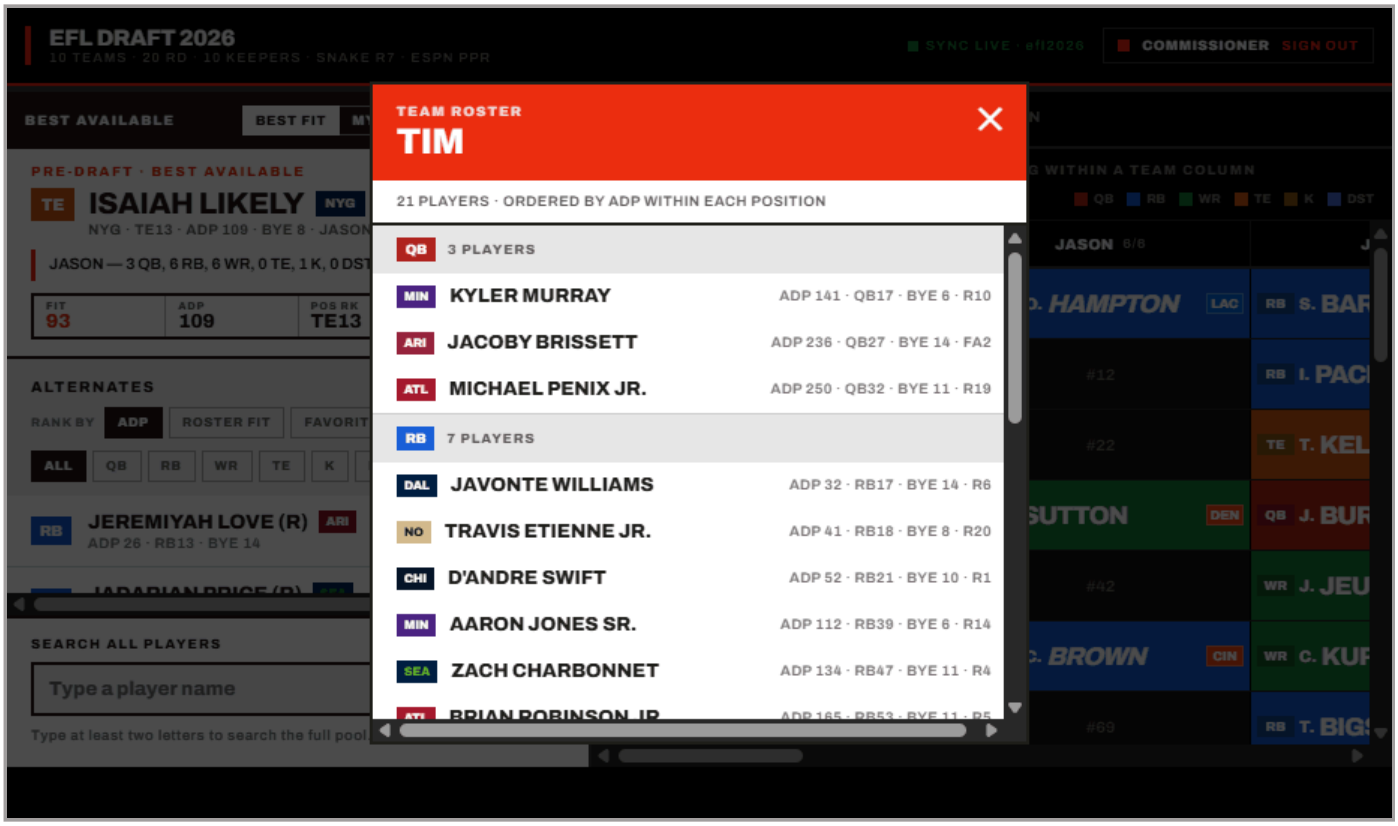

FIG. 4 — TAPPING A TEAM NAME IN THE BOARD HEADER OPENS THAT ROSTER.

The player card

Tap a player's name anywhere it appears — the Players tab, the Cheatsheet, Best Available — and their card opens with everything the board knows about them.

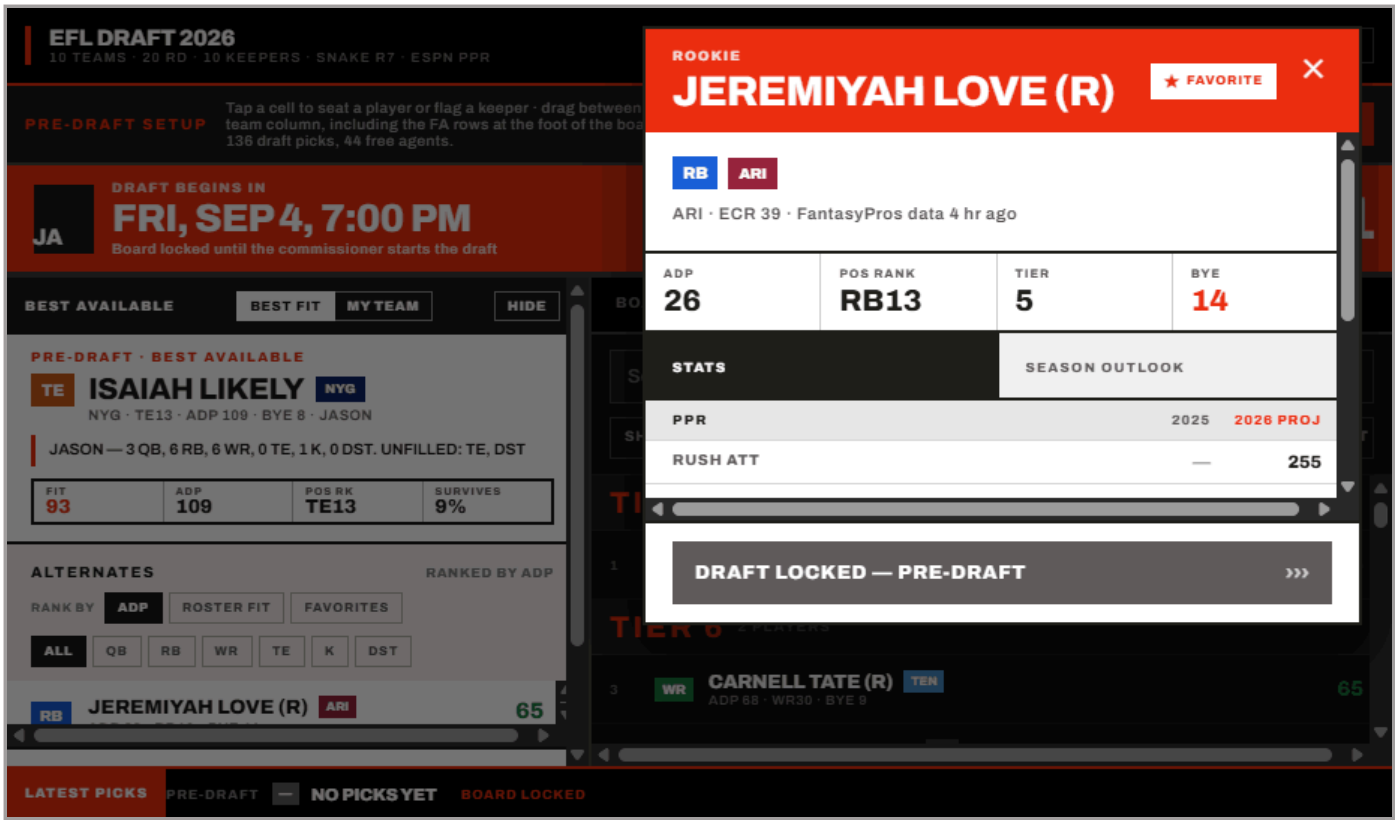

FIG. 5 — THE PLAYER CARD. THE STAT TABLE FILLS OUT ONCE THE COMMISSIONER HAS RUN A DATA REFRESH.

Header — Name, a ROOKIE flag where it applies, the Favorite star, and the close button. A headshot appears beside the name once player photos have been pulled.

Numbers row — ADP, position rank, tier and bye week. Above it, the NFL team, expert consensus rank, injury status and how old the data is.

Stats — Three columns: the stat, last season's actual number, and this season's projection side by side. Passing, rushing and receiving yards and touchdowns, attempts, targets, receptions, and the PPR points total for both years.

Season Outlook — The tab beside STATS. Switches the panel to the expert write-up on the player where one is available, falling back to the most recent news note.

Draft button — Across the bottom. It drafts the player if the pick is yours, and otherwise tells you what it is waiting for — the draft to start, or another manager. If the player is already gone it says who took them and when.

The cheatsheet

The CHEATSHEET button in the Players tab turns the pool into six columns, one per position, each showing the top twenty by ADP. SHOW ALL at the foot of a column opens the rest of it. Drafted players stay in place, faded and struck through, whatever the Show Drafted setting says — the point of the sheet is that a column keeps its shape all night.

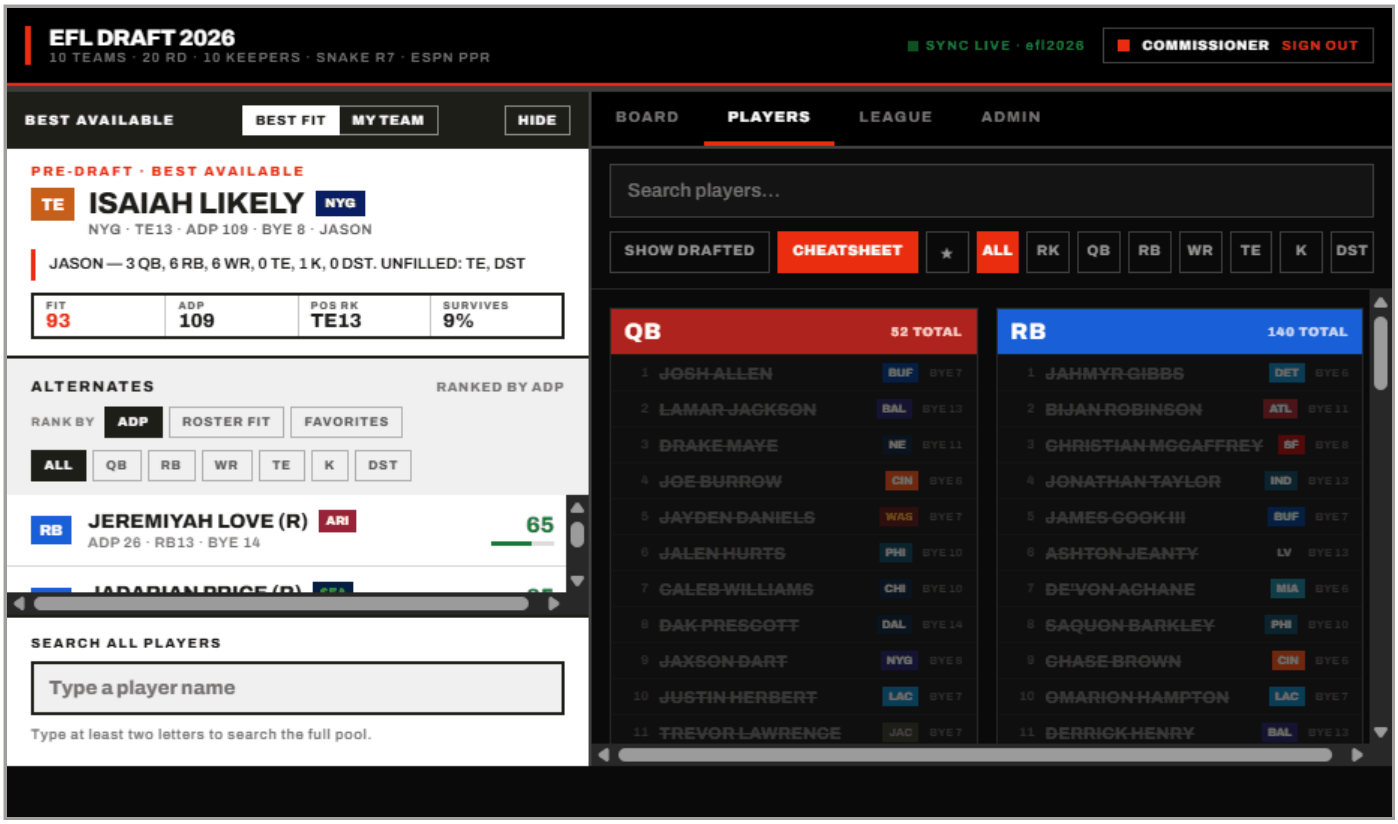

FIG. 6 — THE CHEATSHEET. ONE COLUMN PER POSITION, DRAFTED PLAYERS STRUCK THROUGH IN PLACE.

Searching and filtering

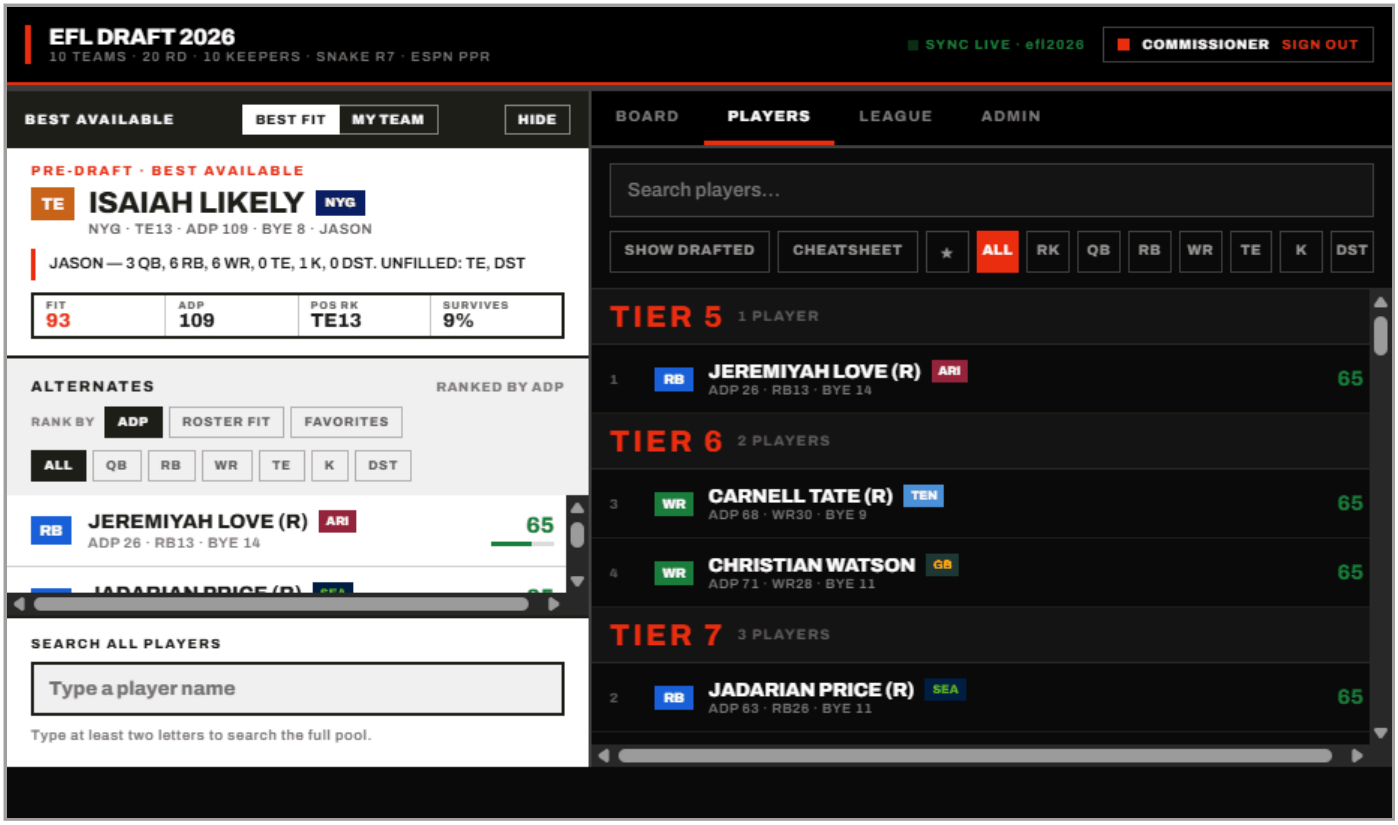

FIG. 7 — THE PLAYERS TAB. SEARCH ACROSS THE TOP, THEN THE FILTER ROW.

Search players	Type two letters or more to search the whole pool by name.
Show drafted	Off by default. Turn it on to see players who are already gone — struck through, with the round and pick that took them.
Cheatsheet	Switches this tab to the six-column view above. Tap it again to come back.
Star	Your favorites only, in ADP order.
ALL · RK · position	Everyone (the default), rookies only, or one position: QB, RB, WR, TE, K, DST.
Tiers	The list is banded by expert tier, so the gap between one group of players and the next is visible as you scroll.

Favorites

Tap the star on a player's card to add them to your list. Favorites are yours alone, saved to your team on that board, and they follow you to any device you sign in on. Two places filter to them: the star button to the left of ALL in the Players tab, and the FAVORITES button in Best Available.

View-only guests do not get favorites, since there is no team to save them to.

The League tab

Every roster in the league, one team after another, grouped by position with ADP, position rank, bye week and the round each player came from. The line beside a team name totals their squad by position. Use the minus beside a name to fold that team away.

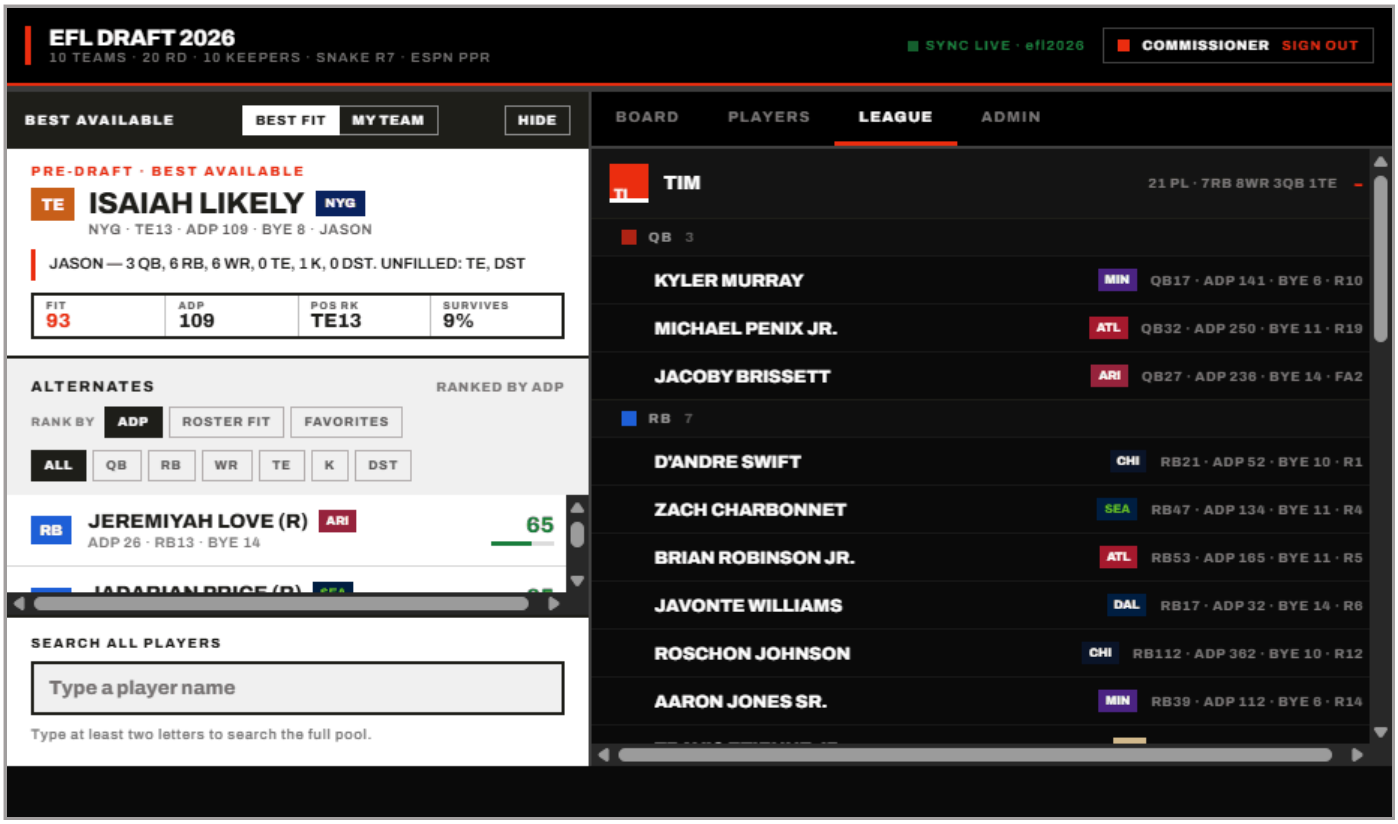

FIG. 8 — THE LEAGUE TAB: EVERY ROSTER, GROUPED BY POSITION.

On a phone or tablet

The tabs move to buttons under the clock strip, and My Pick joins them as the first one — that is where you draft. On a tablet the Latest Picks ribbon pins itself to the bottom of the screen; on a phone it is hidden to save room. Everything else works the same way.

PART TWO

For the commissioner

Everything below lives in the Admin tab, which only a commissioner sees. The sections appear in the order described here as you scroll down that panel.

Draft boards

A board is one draft: its own title, its own sync room, its own teams and its own picks. Boards are shared across every device, so creating one here puts it in everybody's sign-in list.

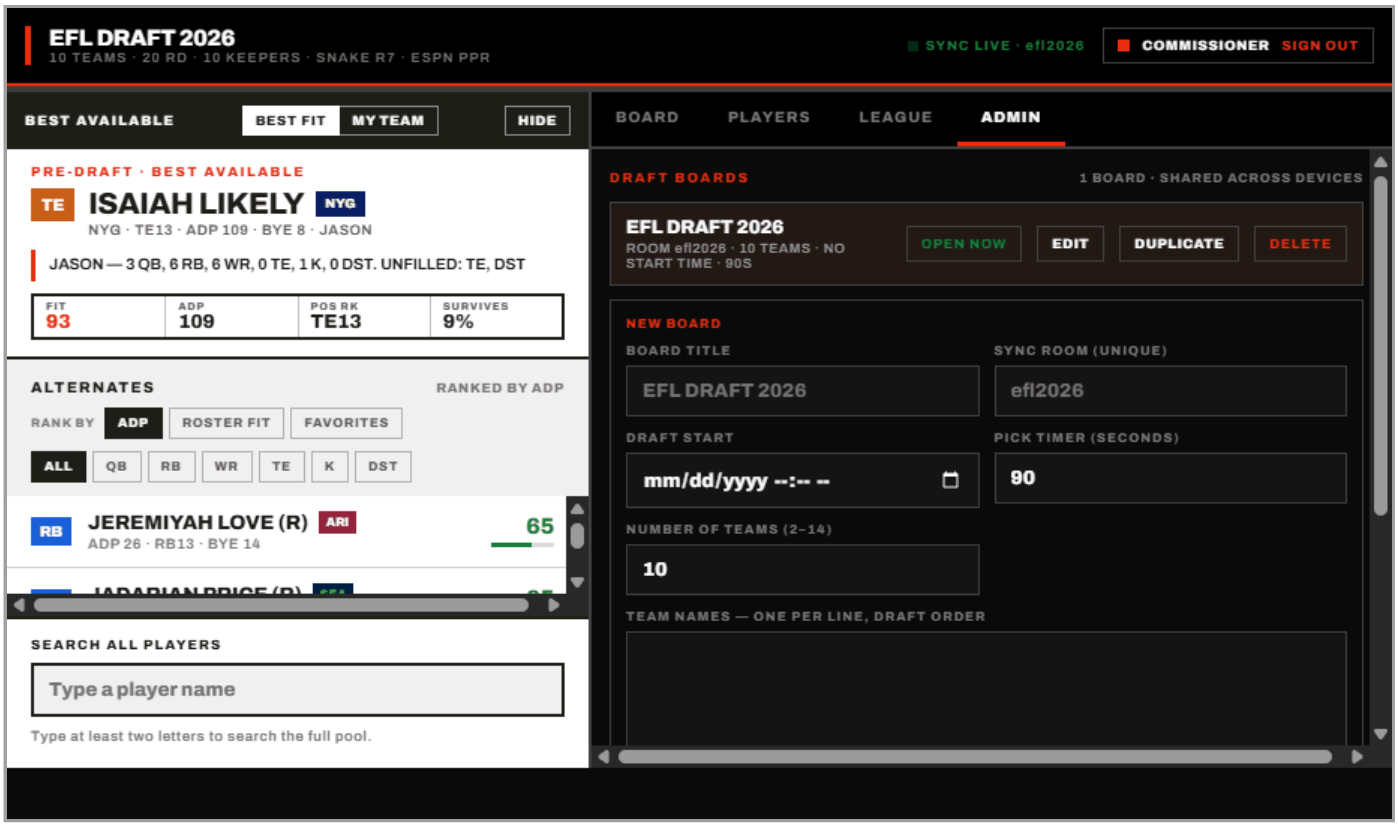

FIG. 9 — ADMIN → DRAFT BOARDS, WITH THE NEW-BOARD FORM UNDERNEATH.

Open now	Switches your own screen to that board.
Edit	Title, sync room, start time, pick timer and team list.
Duplicate	Copies the settings into a new board. Give the copy its own room before you use it.
Sync room	The name of the shared space this board's picks live in. Two boards must never share a room; give each one its own and two drafts can run side by side without touching each other.

League settings

The shape of the draft for the board you are on: league name, start date and time, pick timer in seconds, number of teams, rounds, keepers per team, the round the snake starts from, and the team names themselves. Team names are what managers sign in with, so changing one changes that manager's username.

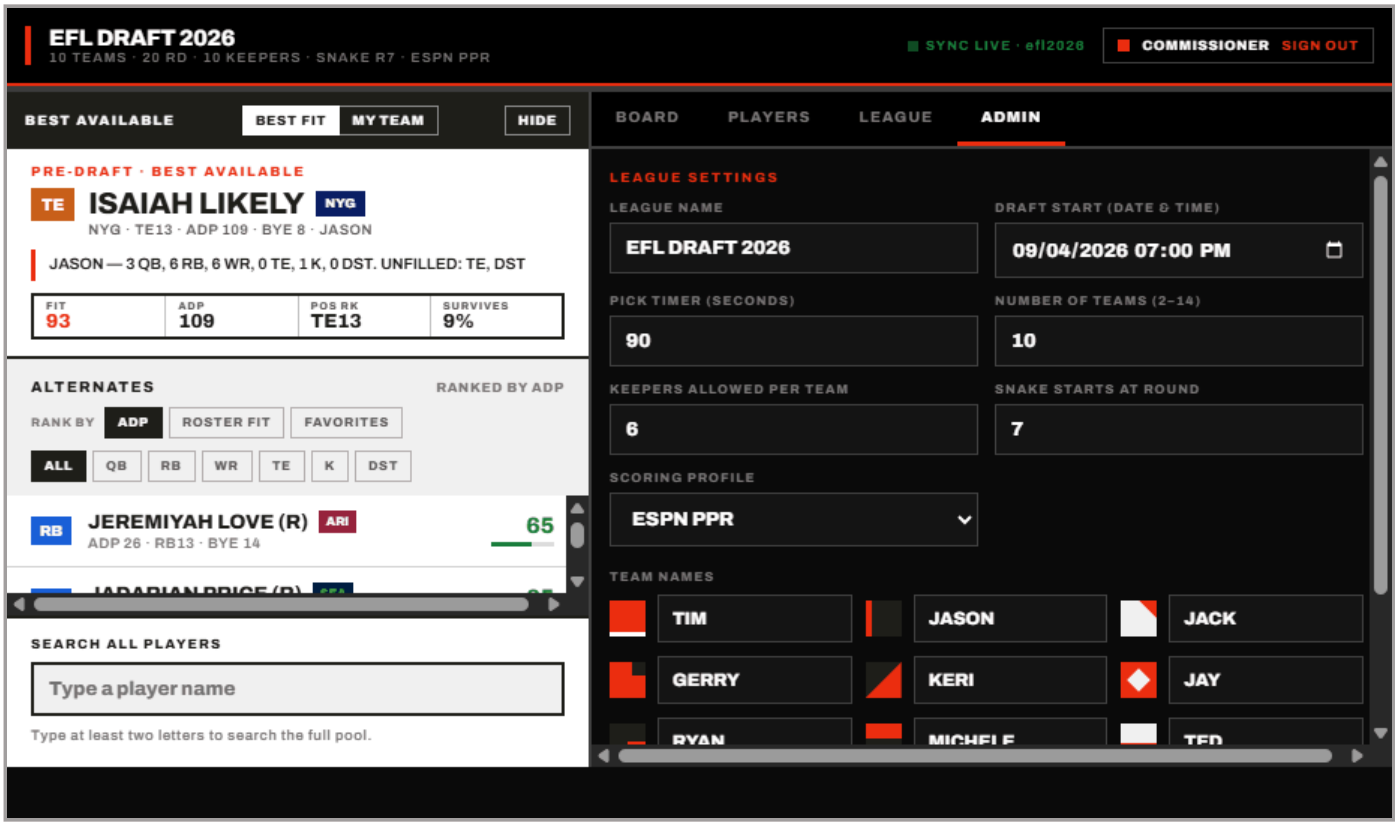

FIG. 10 — ADMIN → LEAGUE SETTINGS.

Loading the player pool

Paste your FantasyPros API key, check the season, and press Refresh from FantasyPros. This is the one thing to do before draft night.

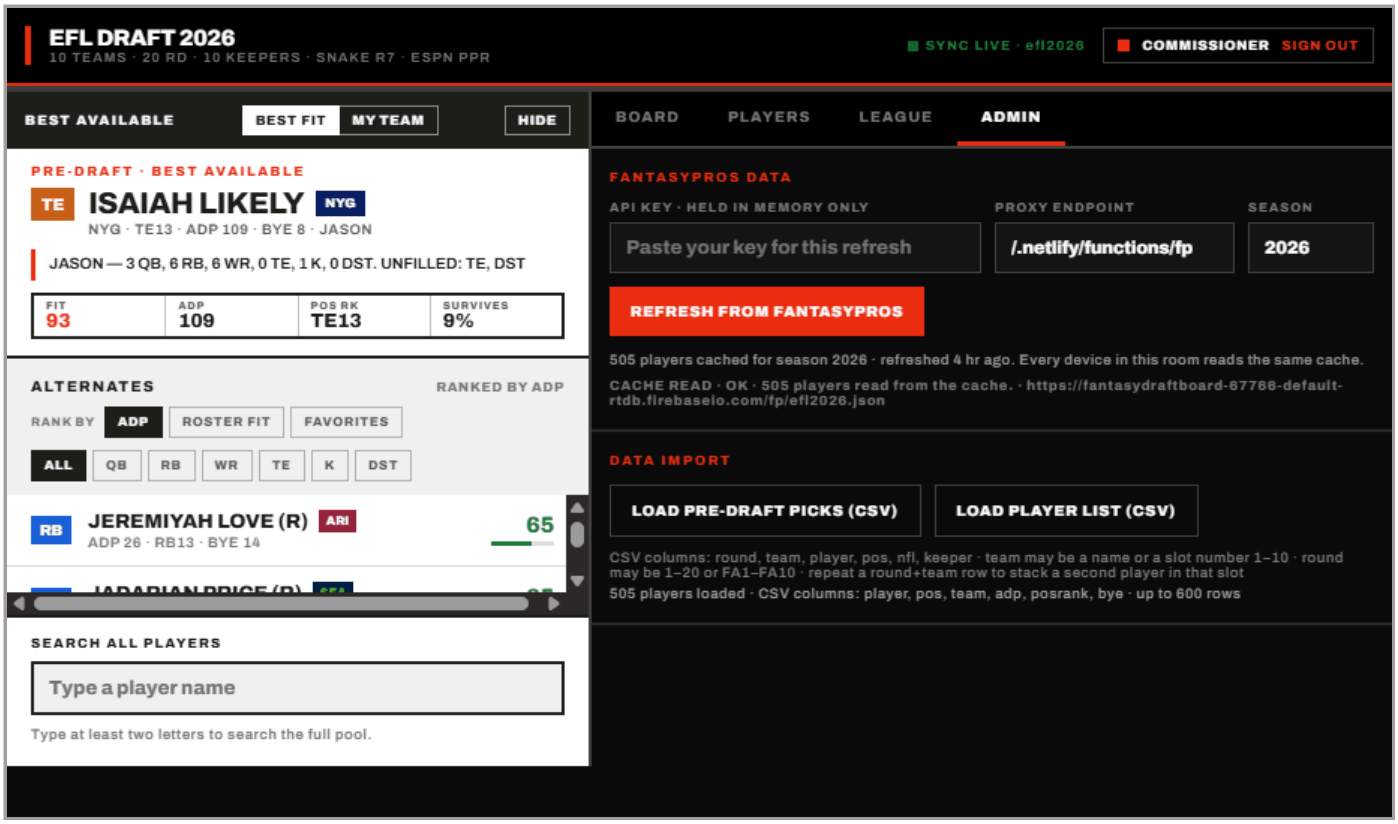

FIG. 11 — ADMIN → FANTASYPROS DATA, WITH DATA IMPORT BELOW IT.

What it pulls	Consensus rankings, ADP, position rank, tier, bye week, injury status and rookie flags from FantasyPros. Last season's real stat line and this season's projection from ESPN, along with the season outlook write-ups and the player photos.
Your key	Used for that one refresh and nothing else. It is never saved to the database, never written into the page and never sent to another device. You paste it each time.
Reach	A refresh replaces the player pool and pushes it to every board in the database, so all your drafts stay in step.
Diagnostics	The lines underneath report what every endpoint returned and how many players matched each kind of data. If a pull comes back near-empty the refresh aborts and nothing is changed.
Proxy endpoint	Leave it alone. Neither data source lets a browser read it directly, so the board reads both through a small proxy that ships alongside it.

Data Import, just below, is the manual route. Load Player List reads a CSV of player, pos, team, adp, posrank and bye, up to six hundred rows. Load Pre-Draft Picks restores a board from a CSV of round, team, player, pos, nfl and keeper — repeat a round and team row to stack a second player in a slot. Export Board (CSV) writes that same shape back out.

Seating keepers

Before the draft the board is in setup mode. Tap any cell to place a player or flag a keeper, and drag between cells in the same team column to move somebody — including the free-agent rows at the foot of the board. The strip above the board keeps a running count of keepers seated, draft picks left and free agents. Nobody can draft until you press start, so there is no rush.

Running the draft

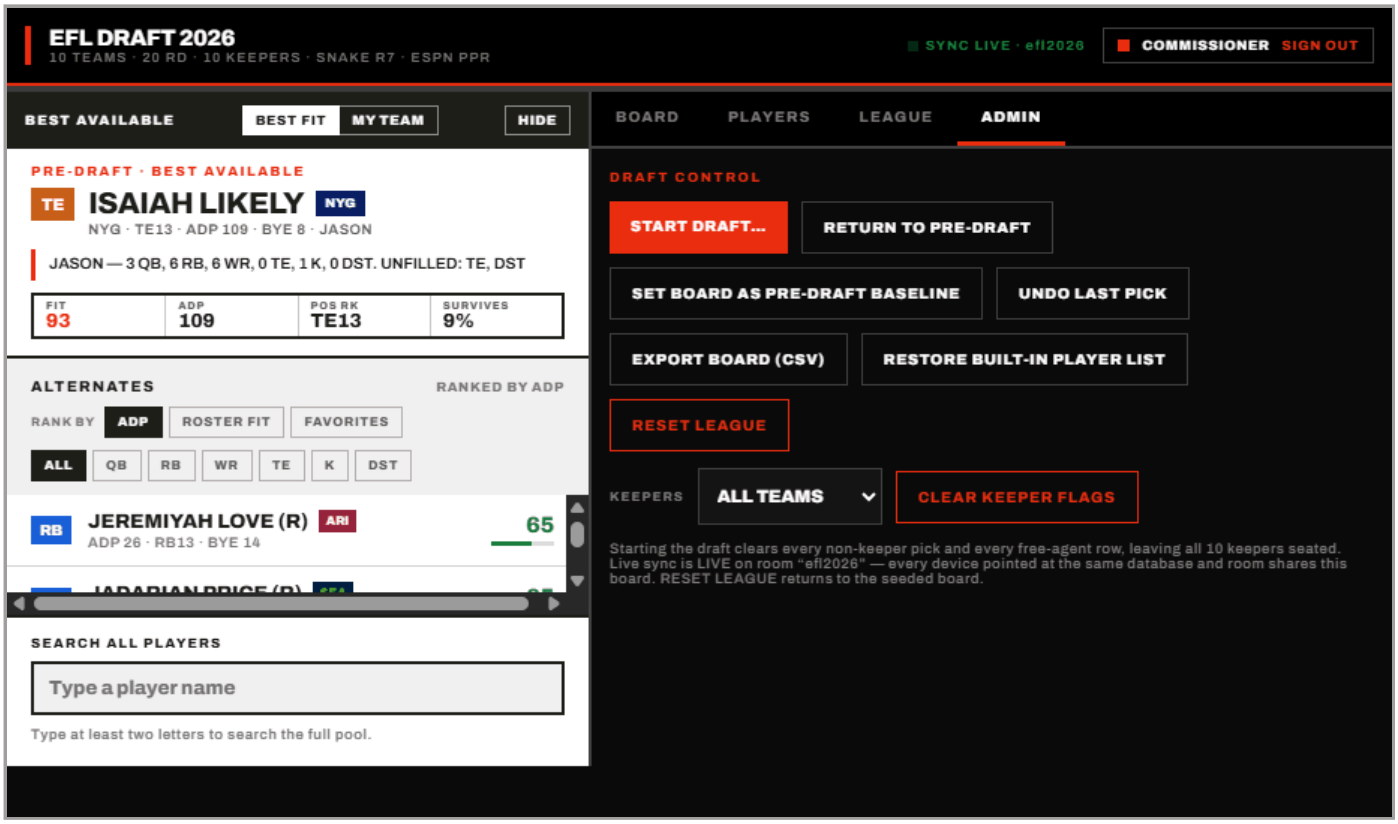

FIG. 12 — ADMIN → DRAFT CONTROL.

Start Draft	Opens the board and starts the clock on the first pick. It asks first.
Clock	Pause, resume or reset at any time. Picks are never blocked by the clock running out — it is a prompt, not a gate.
Drafting for a team	A commissioner can pick for anyone, for the manager who has stepped out of the room.
Return to Pre-Draft	Puts the board back into setup mode with the picks intact, for fixing something mid-draft.
Set as baseline	Records the board as it stands now as the pre-draft state — the point Undo All returns to. Do this once the keepers are seated and correct.
Undo All	Clears every pick made since the baseline. It asks first, and it cannot be reversed.

Trades

Two tools. Trade a Draft Pick reassigns one slot — pick the round and the original slot, choose the new owner, and the board shows the arrow and the TRADED TO note by itself. The Trade Builder handles the bigger swaps: put players and picks on each side, check it reads right, then Execute Trade.

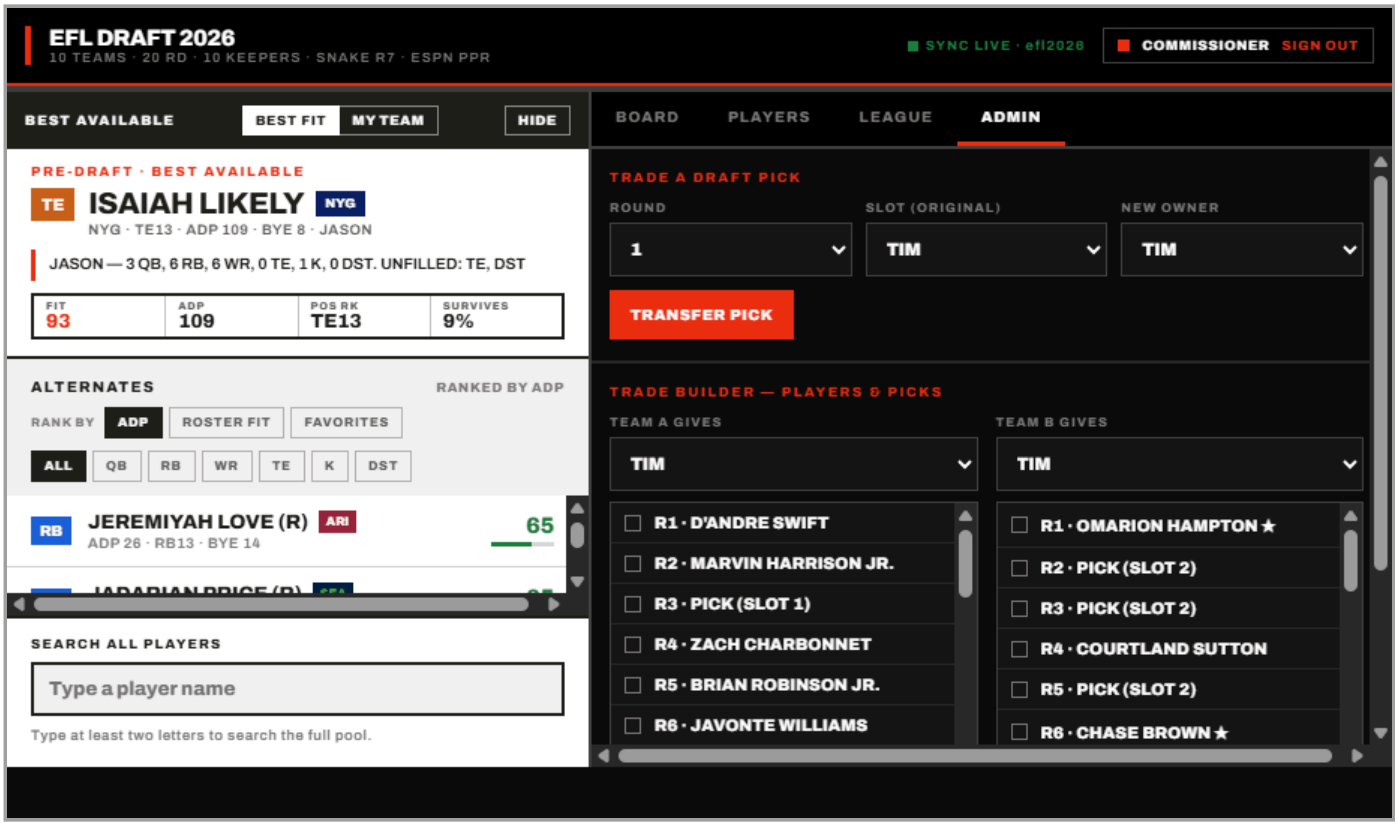

FIG. 13 — ADMIN → TRADE A DRAFT PICK AND THE TRADE BUILDER.

Live sync

The board's picks live in a shared database, not on anyone's device. This section shows the connection, the room the current board is using, and the database address, which is built into the app and read-only. There is nothing to configure on draft night; it is here so you can confirm the room is right and see that the connection is live.

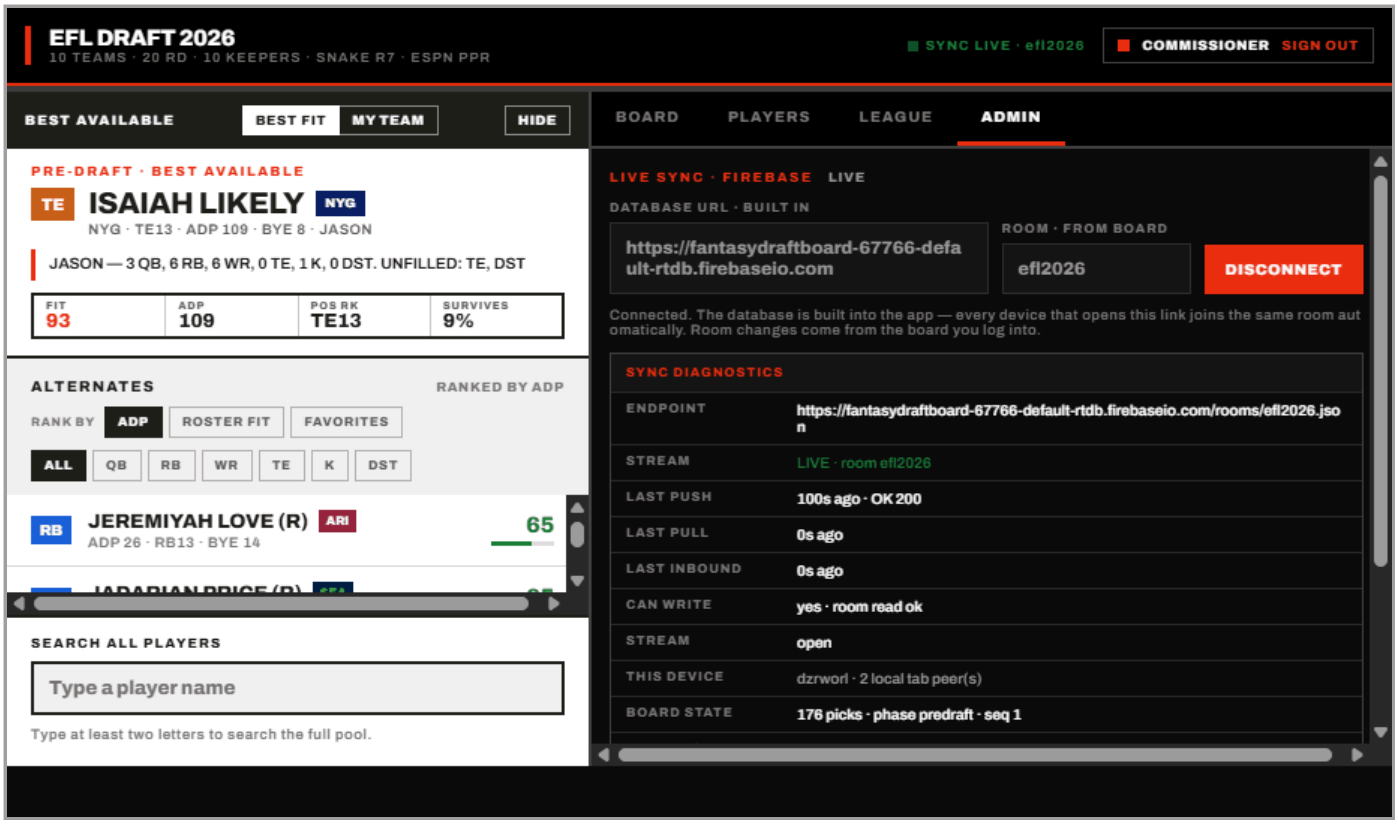

FIG. 14 — ADMIN → LIVE SYNC.

Exports

Export .XLS

Available at any time, from the strip above the board. Two sheets: Pick Detail, one row per pick with team, player, position, NFL team, bye, ADP, position rank and the keeper and rookie flags; and Teams, with teams across the columns and players down the rows, grouped by position and ordered by ADP.

Save Board Image

Available before the draft and once it is complete. Draws the whole board — every round, whatever is on screen — to a wide PNG at double resolution.

Export Board (CSV)

In Admin, under Data Import. The machine-readable version, and the file Load Pre-Draft Picks reads back.

If something goes wrong

- A blank or stale board usually means a device lost its connection. Reload the page — the board is stored centrally, not on the device.
- The sync light at the top right reads SYNC LIVE when a device is connected to the room. If it does not, that device is the problem, not the board.
- Picks are written centrally as they happen, so nothing is lost if a device closes mid-draft.
- If a refresh reports empty endpoints, the existing pool is left untouched. Check the key and try again; the diagnostics name the endpoint that failed.

- Export the .XLS at the end of the night. It is your permanent record.
